Haddock

Georges Bank

Fishery: Georges Bank
Georges Bank
United States
Bottom trawls

IDENTIFICATION

SCIENTIFIC NAME
Melanogrammus aeglefinus

SPECIES NAME(S)
Haddock

STOCK IDENTIFICATION

ASSESSMENT

Strengths
The current biomass estimate are near a time series high. Managers have recently instituted hard quotas to limit catch. Harvest has been below set quotas for a number of years. Managers have recently instituted bycatch quotas, but their effectiveness has not been measured. Managers in both countries are working on bycatch and protected species management measures.

Weaknesses
Model suffers from a retrospective pattern. SSB is overestimated and F underestimated in the terminal year. There is considerable uncertainty surrounding the strength of the most recent year classes. Other trawls, the main gear used to harvest haddock, can cause serious damage to bottom habitat; while other gear types can impact PET species. This fishery tends to close early due to catches of other non-targeted stocks which are retained or discarded; such as yellow tailed flounder and cod. This prevents the full utilization of the quota.

RECOMMENDATIONS

RETAILERS & SUPPLY CHAIN
- Monitor the progress in closing out conditions placed upon the MSC certification of the fishery and if agreed timelines are met, offer assistance in closing conditions where possible.
