Bluenose warehou, Blue-eye trevalla

**SCIENTIFIC NAME**
Hyperoglyphe antarctica

**SPECIES NAME(S)**
Bluenose warehou, Blue-eye trevalla

**COMMON NAMES**
Antarctic butterfish, Australia - Commonwealth, Big-eye, Bluenose, Deep Sea Trevalla

**STOCK IDENTIFICATION**

Blue-eye trevalla (Hyperoglyphe antarctica) are distributed in continental slope waters off South America, South Africa, New Zealand and Australia. Their Australian distribution stretches along the southern continental margin in waters from Moreton Island in Queensland to 30°S in WA. Blue-eye trevalla also occur on the seamounts off eastern Australia and south of Tasmania, Lord Howe Island and probably Norfolk Island. The species supports a significant fishery in New Zealand, where it is known as 'blue-nose' (Baelde 1996).

No genetic differences have been observed between the two different Australian morphs (Bolch et al. 1993) and allozyme surveys on the genetic structure of the blue-eye trevalla stock found no population differentiation in samples examined from NSW, Tasmania and SA (Hindell et al. 2006; Robinson et al. 2008).

Target fisheries for bluenose have occurred in the South Pacific from the early 1980s to the present day. Bluenose appear to prefer cold water as part of their habitat characteristics. Schools of relatively small adults (50–60 cm) are occasionally taken by trawl over smooth, muddy substrates (Anon 2006).

Relationships between the Australasian stocks of bluenose and those beyond the EEZs are unknown. Biological productivity is moderate. There are no available estimates of stock size, biomass or fishing mortality. There are currently no known management measures in place for bluenose (Paulovics and Williams 1995). Australian vessels use bottom longlines and drop lines on the high seas to catch bluenose.

It is important to note that the line fisheries for bluenose on the high seas are part of a multi-species fishery. The other critical component in the catch mix is the wreckfishes (Polyprion spp.) (Wilson et al. 2009).

Mostly a Commonwealth fishery, where blue-eye are assessed as 'not overfished', but there are concerns about possible local depletion in some areas. Catch rates off Fiji of other commercial fishes and the size composition of catches appear to be stable (Anon 2006).

**ASSESSMENT**

**Weaknesses**
Significant amounts of biological and fishery data are available; however the data vary with season, area, depth and fishing method, and a full age-structured population model has not been developed.

**RETAILERS & SUPPLY CHAIN**

This profile is not currently high on our priority list for development, and we are not at this time providing an accurate prediction of when it will be developed. To speed up an evaluation of the sustainability status of lower priority fisheries we have initiated a program whereby industry can directly contract SFP-approved analysts to develop a FishSource profile on a fishery. More information on the External Contributor Program is available at [https://www.sustainablefish.org/Programs/Science/External-Contributor-Program](https://www.sustainablefish.org/Programs/Science/External-Contributor-Program).
