IDENTIFICATION

Scientific Name:
Hyperoglyphe antarctica

Species Name(s):
Bluenose warehou, Blue-eye trevalla

Common Names:
Antarctic butterfish, Australia - Commonwealth, Big-eye, Bluenose, Deep Sea Trevalla

STOCK IDENTIFICATION

Blue-eye trevalla (Hyperoglyphe antarctica) are distributed in continental slope waters off South America, South Africa, New Zealand and Australia. Their Australian distribution stretches along the southern continental margin in waters from Moreton Island in Queensland to 37°S in WA. Blue-eye trevalla also occur on the seamounts off eastern Australia and south of Tasmania, Lord Howe Island and probably Norfolk Island. The species supports a significant fishery in New Zealand, where it is known as ‘blue-nose’ (Baelde 1996).

No genetic differences have been observed between the two different Australian morphs (Bolch et al. 1993) and allozyme surveys on the genetic structure of the blue-eye trevalla stock found no population differentiation in samples examined from NSW, Tasmania and SA (Hindell et al. 2006; Robinson et al. 2008).

Target fisheries for bluenose have occurred in the South Pacific from the early 1980s to the present day. Bluenose appear to prefer cold water as part of their habitat characteristics. Schools of relatively small adults (50–60 cm) are occasionally taken by trawl over smooth, muddy substrates (Anon 2006).

Relationships between the Australasian stocks of bluenose and those beyond the EEZs are unknown. Biological productivity is moderate. There are no available estimates of stock size, biomass or fishing mortality. There are currently no known management measures in place for bluenose (Paulovics and Williams 1995). Australian vessels use bottom longlines and drop lines on the high seas to catch bluenose.

ASSESSMENT

Weaknesses:
Significant amounts of biological and fishery data are available; however the data vary with season, area, depth and fishing method, and a full age-structured population model has not been developed.

RECOMMENDATIONS

RETAILERS & SUPPLY CHAIN

This profile is not currently high on our priority list for development, and we can't at this time provide an accurate prediction of when it will be developed. To speed up an evaluation of the sustainability status of lower priority fisheries we have initiated a program whereby industry can directly contract SFP-approved analysts to develop a FishSource profile on a fishery. More information on this External Contributor Program is available at https://www.sustainablefish.org/Programs/Science/External-Contributor-Program.

Australian Fisheries Management Authority (AFMA)
Fishers

Within FishSource, the term "fishery" is used to indicate each unique combination of a flag country with a fishing gear, operating within a particular management unit, upon a resource. That resource may have a known biological stock structure and/or may be assessed at another level for practical or jurisdictional reasons. A fishery is the finest scale of resolution captured in FishSource profiles, as it is generally the scale at which sustainability can most fairly and practically be evaluated.
