

# Yellow snapper Costa Rica

## IDENTIFICATION

SCIENTIFIC NAME

*Lutjanus argentiventris*

SPECIES NAME(S)

Yellow snapper

COMMON NAMES

pargo amarillo

STOCK IDENTIFICATION

This species is distributed in the Eastern Pacific from southern California to Peru, rarely in the north of Baja California, Mexico; also at the Cocos and Galapagos islands. Found in inshore reef areas over hard bottoms until at least 60 m depth (*Fishbase nd*). The stock structure is unknown, the map regards the species' distribution.

# Fisheries

Within FishSource, the term "fishery" is used to indicate each unique combination of a flag country with a fishing gear, operating within a particular management unit, upon a resource. That resource may have a known biological stock structure and/or may be assessed at another level for practical or jurisdictional reasons. A fishery is the finest scale of resolution captured in FishSource profiles, as it is generally the scale at which sustainability can most fairly and practically be evaluated.
